

**Experiment 1****Date: 21.09.2023****Advanced Use of GCC****Aim:**

1. Advanced use of gcc : Important Options -o, -c, -D, -l, -I, -g, -O, -save-temps, -pg

Write a C program 'sum.c' to add two numbers. Read the input from Standard Input and write output to Standard output. Compile and generate output using gcc command and its important options.

**Program**

```
#include<stdio.h>
void main(){
    int a,b;
    printf("Enter 2 numbers : ");
    scanf("%d %d",&a,&b);
    printf("Sum : %d",a+b);
}
```

**GCC**

GCC is a Linux-based c compiler released by the free software foundation which is usually operated via the command line. It often comes distributed freely with a Linux installation, so if you are running Unix or a Linux variant you will probably have it on your system. You can invoke gcc on a source code file simply by typing:-

**gcc filename**

The default executable output of gcc is "a.out", which can be run by typing "./a.out". It is also possible to specify a name for the executable file at the command line by using the syntax " -o outputfile", as shown in the following example: -

**gcc filename -o outputfile**

Again, you can run your program with "./outputfile". (the ./ is there to ensure to run the program for the current working directory.)

Note: if you need to use functions from the math library (generally functions from math.h" such as sin or sqrt), then you need to explicitly ask it to link with that library with the "-l" flag and the library "m":

**gcc filename -o outputfile -lm**

### **Output**

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc sum.c
mits@mits:~/Desktop/S1MCA/ADS_lab$ ./a.out sum.c
Enter 2 numbers : 10 20
Sum : 30
```

## **Important Options in GCC**

### **Option: -o**

To write and build output to output file.

### **Output**

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc sum.c -o sum_out
```

Here, GCC compiles the sum.c file and generates an executable named sum\_out.

### **Option: -c**

To compile source files to object files without linking.

### **Output**

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc -c sum.c
```

This will generate an object file sum.o that can be linked separately.

**Option: -D**

To define a preprocessor macro.

**Output**

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc -D debug=1 sum.c
```

This defines the macro 'DEBUG' with the value 1, which can be used in the source code.

**Option: -I**

To include a directory of header files.

**Output**

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc -o sum.c sum_out.c -lm
```

Here, the -lm option links the math library (libm) with the sum.c.

**Option: -I**

To look in a directory for library files.

**Output**

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc -o sum.c sum_out.c  
-I./ads_lab
```

This tells GCC to look for header files in the ads\_lab directory.

**Option: -g**

To debug the program using GDB.

**Output**

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc -g sum.c -o sum_out
```

This compiles sum.c with debug information, enabling you to debug the resulting executable.

**Option: -O**

To optimize for code size and execution time.

**Output**

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc -O3 -o my_pgm sum.c
```

This compiles sum.c with a high level of optimization.

**Option: -pg**

To enable code profiling.

**Output**

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc -pg -o my_pgm sum.c
```

This compiles source.c with profiling support, allowing you to use profilers like gprof.

**Option: -save-temps**

To save temporary files generated during program execution.

**Output**

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc -save-temps -o my_pgm  
sum.c
```

This will generate intermediate files, like sum.i (pre-processed source) and sum.s (assembly code), in addition to the final executable.

**Experiment 2****Date: 21.09.2023****Familiarisation with GDB****Aim:**

2. Familiarisation with gdb: Important Commands - break, run, next, print, display, help.

Write a C program 'mul.c' to multiply two numbers. Read the input from Standard Input and write output to Standard output. Compile and generate sum.out which is then debug with gdb and commands.

**Program**

```
#include<stdio.h>
void main(){
    int a,b;
    printf("Enter 2 numbers : ");
    scanf("%d %d",&a,&b);
    printf("Product : %d",a*b);
}
```

**Output**

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc -g mul.c -o mul_out
mits@mits:~/Desktop/S1MCA/ADS_lab$ gdb mul_out
```

Reading symbols from sum1...

(gdb) **run**

Starting program: /home/mits/Desktop/Poojas1MCA/sum1

[Thread debugging using libthread\_db enabled]

Using host libthread\_db library

"/lib/x86\_64-linux-gnu/libthread\_db.so.1".

Enter 2 numbers : 10 20

Product : 200 [Inferior 1 (process 23588) exited normally]

(gdb) **quit**

## **Important Commands in GDB**

### **Command: break**

Sets a breakpoint on a particular line.

### **Output**

(gdb) break mul.c:5

### **Command: run**

Executes the program from start to end.

### **Output**

(gdb) run

### **Command: next**

Executes the next line of code without diving into functions.

### **Output**

(gdb) next

**Command: print**

Displays the value of a variable.

**Output**

(gdb) print a

(gdb) a 10

**Command: display**

Displays the current values of the specified variable after every step.

**Output**

(gdb) display a

1: a=10

**Experiment 3****Date: 29.09.2023****Familiarisation with gprof****Aim:**

3. Write a program for finding the sum of two numbers using a function. Then profile the executable with gprof.

**Program**

```
#include<stdio.h>
int sum(int x, int y){
    return x+y;
}
void main(){
    int a,b;
    printf("Enter 2 numbers : ");
    scanf("%d %d",&a,&b);
    printf("Sum : %d",sum(a,b));
}
```

**Output**

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc sum.c
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc ./a.out sum.c
Enter 2 numbers : 10 20
Sum : 30
```

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc -o sum.out -pg sum.c
mits@mits:~/Desktop/S1MCA/ADS_lab$ ./sum.out
Enter 2 numbers : 10 20
Sum : 30
```

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gprof ./sum.out gmon.out >
pgm3.txt
```

**pgm3.txt**

Flat profile:

Each sample counts as 0.01 seconds.  
no time accumulated

%	cumulative	self		self	total	
time	seconds	seconds	calls	Ts/call	Ts/call	name
0.00	0.00	0.00	1	0.00	0.00	sum

**Experiment 4****Date: 29.09.2023****Different types of functions****Aim:**

4. Write a program for finding the sum of two numbers using different types of functions.

**Algorithm:****main()**

1. Start
2. Declare ch,a,b.
3. Display choices.
4. Read option ch.
  - a. if ch==1 call sum1().
  - b. if ch==2 input a and b and call sum2().
  - c. if ch==3 print sum3().
  - d. if ch==3 input a and b and print sum4().
5. Repeat steps 3 while ch>0&&ch<4.
6. Stop.

**void sum1()**

1. Start
2. Declare a and b.
3. Read a and b.
4. Print a+b.
5. Exit.

**void sum2(int a, int b)**

1. Start
2. Print a+b.
3. Exit.

**int sum3()**

1. Start
2. Declare a and b.
3. Read a and b.
4. Return a+b.
5. Exit.

**int sum4(int a, int b)**

1. Start
2. Return a+b
3. Exit.

**Program**

```
#include<stdio.h>
void sum1(){
    int a,b;
    printf("Enter 2 numbers : ");
    scanf("%d %d",&a,&b);
    printf("Sum : %d",a+b);
}
void sum2(int a, int b){
    printf("Sum : %d",a+b);
}
int sum3(){
    int a,b;
    printf("Enter 2 numbers : ");
    scanf("%d %d",&a,&b);
    return a+b;
}
int sum4(int a, int b){
    return a+b;
}
void main(){
    int ch,a,b;
    do{
        printf("1. Function without return type and arguments\n2. Function\nwithout return type and with arguments\n3. Function with return type and\nwithout arguments\n4. Function with return type and arguments\n5. Exit\nEnter\nyour choice(1-4): ");
        scanf("%d", &ch);
        switch(ch){
            case 1: sum1();
                break;
            case 2: printf("Enter 2 numbers : ");
                scanf("%d %d",&a,&b);
                sum2(a,b);
                break;
```

```
        case 3: printf("Sum : %d",sum3());
                break;
        case 4: printf("Enter 2 numbers : ");
                scanf("%d %d",&a,&b);
                printf("Sum : %d",sum4(a,b));
                break;
    }
}while(ch>0&&ch<4);
}
```

### **Output**

```
mits@mits:~/Desktop/S1MCA/ADS_lab$ gcc PGM4.c
mits@mits:~/Desktop/S1MCA/ADS_lab$ ./a.out PGM4.c
```

```
1. Function without return type and arguments
2. Function without return type and with arguments
3. Function with return type and without arguments
4. Function with return type and arguments
5. Exit
Enter your choice: 1
Enter 2 numbers : 10 20
Sum : 30
```

```
1. Function without return type and arguments
2. Function without return type and with arguments
3. Function with return type and without arguments
4. Function with return type and arguments
5. Exit
Enter your choice: 2
Enter 2 numbers : 25 25
Sum : 50
```

```
1. Function without return type and arguments
2. Function without return type and with arguments
3. Function with return type and without arguments
4. Function with return type and arguments
5. Exit
Enter your choice: 3
Enter 2 numbers : 100 100
Sum : 200
```

1. Function without return type and arguments
2. Function without return type and with arguments
3. Function with return type and without arguments
4. Function with return type and arguments
5. Exit

Enter your choice: 4

Enter 2 numbers : 250 250

Sum : 500

1. Function without return type and arguments
2. Function without return type and with arguments
3. Function with return type and without arguments
4. Function with return type and arguments
5. Exit

Enter your choice: 5

**Experiment 5****Date: 06.10.2023****Array Operations****Aim:**

5. To implement a menu driven program to perform following array operations
  - a. Insert an element to a particular location.
  - b. Delete an element from a particular location.
  - c. Traverse

**Algorithm:****main()**

1. Start
2. Declare ch,a[50],p,x and n.
3. Display choices.
4. Read option ch.
  - a. if ch==1 call insert().
  - b. if ch==2 call del().
  - c. if ch==3 call display()
5. Repeat steps 3 while ch>0&&ch<4.
6. Stop.

**void insert()**

1. Start
2. Read the element and it's position.
3. Check if p>n if true print Invalid Position.
4. else n++

```
for(int i=n-1;i>=p;i--){
    a[i]=a[i-1];
}
```

```
a[p-1]=x;
```
5. Exit

**void del()**

1. Start
2. Read the position of the element to be deleted.
3. Check if  $p > n$  if true print Invalid Position.
4. else n–

print a[p-1] is deleted

```
for(int i=p-1;i<=n-1;i++){  
    a[i]=a[i+1];
```

5. Exit

**void display()**

6. Start
7. for(int i=0;i<n;i++){  
 print a[i]  
 }  
8. Exit

**Program**

```
#include<stdio.h>
```

```
int a[50],p,x,n;
```

```
void insert(){  
    printf("Enter the element and it's position : ");  
    scanf("%d %d",&x,&p);  
    if(p>n){
